

ENGINEERING SPECIFICATIONS

All Lark Portable Buildings are engineered and manufactured to the following wind load specifications:

All Accu-Steel Models

Wind loading of 3 second gust of 150 mph is standard on all models

Wood Frame Models

Wind loading of 3 second gust of 130 mph is standard

Wind loading of 3 second gust of 150 mph is available as an option

If needed, sealed engineered plans are available for all models upon request for a nominal fee.

PLEASE NOTE

The sizes used to identify each building is approximate because of the limitations on the widths and lengths that can be transported. The actual measurements of our buildings could be less or more than the size indicated.

Some models are shown with optional features. Please check with your dealer for information on standard features and available options.

KEEPING THE COMMITMENT

At Lark, we are not satisfied with setting the industry standard for quality, durability, and product value. We know that to stay out in front of the competition and continue to build the best, we must critically evaluate our product and manufacturing process daily. This constant attention to product improvement and customer satisfaction has made Lark the undisputed leader in portable buildings.

After thirty eight years of setting the standard, we have above all, learned one thing, that nothing ever stays the same. Products and customer requirements constantly change. Better building material and manufacturing methods are created almost daily.

If we are to work in the best interest of our customer, we must keep making the refinements and improvements that keeps our products on the cutting edge.

We realize that purchasing a portable building is no small matter, it is a major commitment of financial resources. For this reason, before you purchase any portable building, you owe it to yourself to compare Lark's product, quality, and price to any competitor's model and you will be convinced that there is only one choice and that it is Lark every time.
